

HLD: Distributed Caching

"Concept & Coding" YT Video Notes

- What is Caching?
- What is Distributed Caching and how its done?
- Caching Strategy:
 - o Cache aside
 - o Read-Through
 - o Write Around
 - o Write through
 - o Write Back
- Cache Eviction Policies
 - o LRU
 - o FIFO
 - o LFU etc.

Part I

Part II

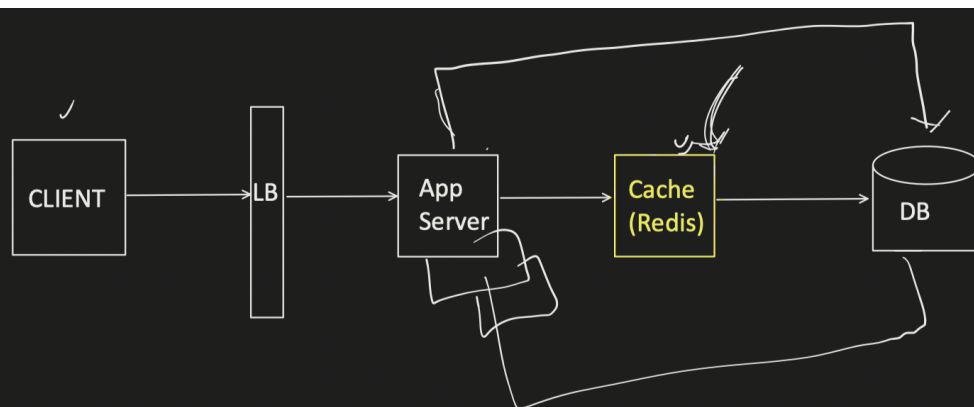

What is Caching?

- Caching is a technique to store frequently used data in a fast access memory rather than accessing data every time from slow access memory.
- This makes our system very fast.
- It helps to reduce the latency.
- It also helps to achieve the fault tolerance.

There are different types of caching present at different layer of the system Like:

- Client side Caching (Browser Caching)
- CDN (used to store the static data)
- Load Balancer
- **Server Side Application Caching (like Redis etc.)**
- etc.

What is Distributed Caching?
