

HLD: Distributed Transaction Handling (2PC, 3PC and SAGA)

"Concept & Coding" YT Video Notes

What is Transaction:

It refers to a set of operations which need to be performed or simply say group of tasks which need to be performed against the DB.

It has 4 properties:

- Atomicity: All operations in a single transaction should be success or all should fail.
- Consistency: DB should be in consistent state before and after the transaction.
- Isolation: More than one transaction that is running concurrently, appears to be serialized.
- Durability: After transaction successfully completed, even if DB fails, data should not get lost.

```
Txn
Begin_Transaction;
- Withdrawal Money from 'A': Rs 100
- Deposit Money to 'B': Rs 100
If all success:
    Do Commit ✓
else
    Do Rollback
Close_Transaction;
```

How to handle this in Distributed System, where operations involves multiple databases?
or
As Transaction is Local to a particular database? How we will satisfy the transaction Property in Distributed system?

How to handle Transaction in Distributed System?
